

KSP INTELLIGENCE COMMAND

Visual Inspiration & International Benchmark Gallery

ACTUAL USER-PROVIDED REFERENCE SCREENSHOTS

Purpose

A visual study of international crime-intelligence, geospatial analytics and investigation platforms, followed by observations that can directly influence the Karnataka State Police hackathon dashboard.

Reference families included

INTERPOL INSIGHT • Esri public-safety dashboards • IBM i2 Analyst's Notebook

Important: The screenshots in this document are the images supplied by the user for benchmarking/inspiration. The KSP recommendations are original design observations, not representations of an existing KSP product.

1. INTERPOL INSIGHT — Connected Crime Intelligence

Explore INTERPOL Data and display in various formats

Geospatial visualizations

Full-featured, shareable investigation graph functionality

AI features to extract entities from free text

Interactive dashboards

- **What stands out:** one analytical environment brings together dashboards, maps, investigation graphs and AI-assisted extraction.
- **KSP lesson:** do not build isolated screens for GIS, cases and AI. They should be different views over one shared intelligence context.
- **Best idea to borrow:** *Integrate* → *Analyse* → *Act*. A state dashboard should lead users from a signal to evidence and then to an operational decision.

Reference: INTERPOL Project INSIGHT — <https://www.interpol.int/en/How-we-work/Criminal-intelligence-analysis/Projects/Project-INSIGHT>

2. Investigation Analytics — Network + Map + Time

- **What stands out:** the analyst can move between relationship networks, geography and time-series behaviour without leaving the investigation context.
- **KSP lesson:** a case should not be a flat record. It should be explorable through Case → People → Location → Time → Related Cases.
- **Best idea to borrow:** linked selections. Choosing a network node or geographic cluster should filter the other analytical views.

Reference: IBM i2 Analyst's Notebook / investigation analytics — https://www.ibm.com/docs/SS3J58_9.2.1/com.ibm.i2.anb.doc/analysts_notebook_pdf.pdf

3. Esri Philadelphia Crime Dashboard — KPI + Map

- **What stands out:** KPI cards, daily trend, map, crime feed and category charts coexist on one operational screen.
- **KSP lesson:** the command centre should answer 'what changed?' before asking the user to navigate elsewhere.
- **Best idea to borrow:** filter-aware tiles. Clicking a district/crime category should update the map, trends and case feed.

Reference: Esri Law Enforcement / Public Safety — <https://www.esri.com/en-us/industries/law-enforcement/overview>

4. Esri Police Department Dashboard — Dark Command View

- **What stands out:** a dark, high-contrast operational presentation makes a dense map and live feed feel like a command-centre workspace.
- **KSP lesson:** use a strong visual hierarchy: map as the central canvas, attention feed at the side, and compact analytical summaries above/below.
- **Best idea to borrow:** operational focus. Avoid decorative charts; every panel should help answer a policing question.

Reference: Esri Law Enforcement / Public Safety — <https://www.esri.com/en-us/industries/law-enforcement/overview>

5. Esri Insights — Heatmap + Trend Analysis

- **What stands out:** a heatmap is combined with a category chart and a time trend, allowing geography, volume and change to be interpreted together.
- **KSP lesson:** a hotspot should never be only a red patch on a map. Show the supporting trend, crime mix and time behaviour.
- **Best idea to borrow:** evidence-backed hotspot cards: 'why is this area highlighted?'

Reference: Esri Daily Activity / Crime Dashboard concepts — <https://www.esri.com/arcgis-blog/products/arcgis-solutions/public-safety/daily-activity-dashboard-solution-updated>

6. Esri Daily Crime Dashboard — Filters + Map + Feed

- **What stands out:** filters, map, crime feed and comparative charts are tightly connected.
- **KSP lesson:** use progressive drill-down: Karnataka → district → unit → hotspot → crime type → supporting FIRs.
- **Best idea to borrow:** persistent filter context. Users should always know what subset of data they are viewing.

Reference: Esri Daily Activity / Crime Dashboard concepts — <https://www.esri.com/arcgis-blog/products/arcgis-solutions/public-safety/daily-activity-dashboard-solution-updated>

7. IBM i2 Analyst's Notebook — Link / Network Analysis

- **What stands out:** relationship graphs make complex associations visible and support analytical measures such as centrality.
- **KSP lesson:** the People & Networks workspace should reveal connections among cases, persons, locations and other entities.
- **Governance note:** graph centrality or association is an investigative signal, not proof of guilt. Use neutral terminology and link every node back to evidence.

Reference: IBM i2 Analyst's Notebook — <https://www.ibm.com/support/pages/download-ibm-i2-analysts-notebook-922>

8. IBM i2 — Investigation Workspace: Analytics + Map + Network

- **What stands out:** the investigation workspace combines analytics panels, a map and a large relationship graph.
- **KSP lesson:** geography and relationship intelligence should coexist. A location can be an entity in the network, not just a map coordinate.
- **Best idea to borrow:** clicking an entity should reveal its supporting records, cases and events.

Reference: IBM i2 Analyst's Notebook — https://www.ibm.com/docs/SS3J58_9.2.1/com.ibm.i2.anb.doc/analysts_notebook_pdf.pdf

9. IBM i2 — Network + Time Analysis

- **What stands out:** network analysis is paired with temporal views, allowing relationship strength and timing to be examined together.
- **KSP lesson:** 'who is connected?' and 'when did the relationship occur?' are different questions that should be answered together.
- **Best idea to borrow:** timeline filtering for networks and cases.

Reference: IBM i2 Analyst's Notebook — https://www.ibm.com/docs/SS3J58_9.2.1/com.ibm.i2.anb.doc/analysts_notebook_pdf.pdf

10. IBM i2 — Relationship / Communication Analysis

- **What stands out:** a communication/relationship network is shown alongside frequency and time-of-week analysis.
- **KSP lesson:** investigation analytics can expose recurring patterns that are difficult to see in ordinary case tables.
- **Best idea to borrow:** add time windows and frequency metrics to network exploration, while preserving source traceability.

Reference: IBM i2 Analyst's Notebook — https://www.ibm.com/docs/SS3J58_9.2.1/com.ibm.i2.anb.doc/analysts_notebook_pdf.pdf

11. IBM i2 — Network + Temporal Analysis

- **What stands out:** network structure and temporal activity are presented together with analytical controls.
- **KSP lesson:** advanced analytics should remain interactive: analysts should be able to isolate nodes, links, time windows and clusters.
- **Best idea to borrow:** an 'Explain this connection' action in the KSP Copilot that cites the underlying cases/events.

Reference: IBM i2 Analyst's Notebook — https://www.ibm.com/docs/SS3J58_9.2.1/com.ibm.i2.anb.doc/analysts_notebook_pdf.pdf

12. IBM i2 — Geographic + Network Investigation

- **What stands out:** geography, relationship links and temporal activity are combined in one investigation view.
- **KSP lesson:** this is a strong model for a future KSP 'Investigation Intelligence' screen.
- **Best idea to borrow:** Case → Network → Map → Timeline as a single investigative journey.

Reference: IBM i2 Analyst's Notebook — https://www.ibm.com/docs/SS3J58_9.2.1/com.ibm.i2.anb.doc/analysts_notebook_pdf.pdf

What We Should Combine for KSP

The strongest direction is not to copy one application. Combine the best interaction patterns into one state-level intelligence workflow.

International pattern	KSP interpretation
Unified intelligence platform	One state-wide context connecting FIRs, people, places, crime categories and investigation activity.
Interactive dashboards	Every tile/filter should be clickable and propagate context to other views.
Geospatial analysis	Karnataka → district → unit → hotspot → case map layers.
Network/link analysis	People, cases, locations, assets and events connected through explainable relationships.
Temporal analysis	Hour/day/month/season patterns plus case and network timelines.
AI/NLP	Copilot summarizes and explains retrieved evidence; it does not invent facts.
Action feedback	Hotspot/signal → intervention → outcome measurement.

Recommended KSP navigation journey

Command Center → Karnataka Map → District → Hotspot → Crime Type → Supporting FIRs → Case Health → People & Network → Copilot Explanation → Intervention → Outcome

The key design principle is: **every analytical observation should lead to evidence, and every evidence view should lead to an action or review decision.**
